## 1 Data file

Suppose we have some data in a file. The final result of including this file with <code>@@@CODE</code> mydat.txt (which implies a code environment starting with !bc dat) looks like this:

```
В
                           C
                                       D
                                                   Ε
                     -0.3427
-0.5622
-0.4818
                                                -0.8472
-0.5253
           -0.9315
                                    -0.1613
-0.9740
           -0.2558
                                                -0.0914
                                   -0.7635
0.9216
            0.7702
                                     0.2155
                                                 0.2967
```

## 2 Complete program and terminal output

The following program (which breaks a page) reads the data in the file and performs analysis (typeset with !bc pypro):

```
if __name__ == '__main__':
    data = readfile('mydat.txt')
    # Treat each column as a variable
    m, s, c = analyze(data.transpose())
    print """
mean=%f
st.dev=%f
correlation matrix:
%s
""" % (m, s, c)
```

The output becomes (typeset with !bc sys):

## 3 Code snippet

Fortran 77 is also sometimes handy. Snippets in that language are typeset inside !bc fcod environments.

```
Fortran code box. r_i = ca_i, \quad i = 1, \dots, n subroutine process(a, n, c, r)
C This subroutine returns array r = c*a integer n real*8 a(n), c, r(n) integer i do i = 1,n r(i) = c*a(i) end do return end
```
